

NEW.... Electronic Manual Extra High Output Applicator with Front Linkage or Baler Mount Options

APPLICATION OF SILAGE ADDITIVES AND HAY PRESERVATIVES

Electronic Manual High Output applicator

Suitable for: Large square and round balers

The ideal solution for applying additives and inoculants

The Electronic Manual High Output Applicator is the solution for large square and high output round baler users needing a robust, well built applicator system for applying additives and inoculants to silage and haylage.

Unlike the Automatic systems, the Electronic Manual High Output is designed to apply a fixed rate. This is set by the operator using the in-cab control terminal to alter the pressure at which the product is applied. This in turn with three tip options can be used to increase or decrease the application rate

The X-Hi Manual applicator is a high flow system designed to cope with the output demands of the modern balers during the silage and haylage making process. It is designed to provide a fixed rate application controlled by the operator.

For even greater flexibility, in the future it will also be possible to upgrade the Electronic Manual system to the full 600 Series specification for large square balers and 300 Series specification for round balers.

Adding a 600 or 300 Series Moisture Monitor system will provide precision moisture readings so the operator can apply products at the optimum rates. Alternatively a moisture reading can also be obtained using a hand held moisture meter.

The system can be easily upgrade for applying hay preservative to ensure complete and accurate coverage

OPTIONAL EQUIPMENT: Digital Flow Meter, where precision application rates are required

The 457 control box for the Electronic Manual Applicator has an on/off switch and a dial to control output

Available as a baler fit for large square and round balers, designed to bolt onto your baler type with little or no fabrication

NEW.... Front Linkage Mounted Electronic manual high output applicator 410 litre

OPTIONAL EQUIPMENT: Crop-Eyes can be optionally added to pause the applicator when no crop is entering the baler
